Problem
CIPTI wanted to automate its backups, leaving manual work in the past, which is why the company needed a shared storage solution.

Solution
After the implementation of StarWind VSAN, the company now has perfectly working shared storage solution.

Problem

CIPTI has worked with a virtualized Hyper-V environment. All things considered, the infrastructure worked just fine, except for the fact that it lacked any shared storage, for all server backups used to be performed manually. It can be easily imagined how would that slow down the performance and workload, not to mention security, reliability, and data availability. Naturally, the company has started looking for an alternative.

Solution

StarWind enabled **CIPTI** to manage their data backups automatically. Since **StarWind Virtual SAN** (VSAN) eliminates the need in shared physical storage and mirrors internal hard disks and flash between hypervisor servers, that way manual backups for the company became history. High performance and data high availability (HA) were not the only benefits for the company, meaning StarWind support t hat continues to solve the problems with ease.

"

StarWind satisfies all the requirements.
