Problem

Before deploying StarWind VSAN, Hotels Unlimited had a lack of redundancy and needed to scale storage and compute layers separately.

Solution

Hotels Unlimited deployed StarWind VSAN to get highly available (HA) storage using hardware vendor of their choice without breaking budgets.

Problem

Before deploying **StarWind Virtual SAN (VSAN)**, **Hotels Unlimited** had Dell servers and storage with Microsoft Hyper-V on top. The main problem of the existing infrastructure constituted a lack of redundancy. Besides, in terms of infrastructure growth, the company needed to scale storage and compute separately. Hyperconvergence wasn't really an option in this case. So, the company required a solution fitting to existing compute and storage separated IT infrastructure architecture.

Solution

After deploying **StarWind VSAN Hotels Unlimited** obtained highly available (HA) storage at a reasonable price. StarWind VSAN supports compute and storage separated architecture and allowed the company to scale compute and storage resources independently. The company was able to provide redundant storage to its Hyper-V cluster. **StarWind** satisfies the company's existing requirements to have HA storage on site and has been working well for them. In the future, Hotels Unlimited plans to use StarWind to store backups in Azure.
